

Quantitative Risk-Mitigation Score (RMS)

We cannot manage what we cannot measure. The RMS provides an objective "Hireability Index" based on the 5-Layer Framework.

The Logic Behind the Weights:

You will notice that **Impact (Layer 3)** and **Storyline (Layer 4)** carry the highest weight (50% of the total score). This is intentional.

- **Skills (Layer 2)** are commodities; they can be learned in a bootcamp.
- **Narrative and Impact** are differentiators; they prove engineering maturity.
- **Foundation (Layer 1)** is a "Gatekeeper"; if it fails, nothing else matters, hence the significant 20% penalty for bad formatting.

A. The Weighted Scoring Matrix

Category	Weight	Why this weight?
L1: Foundation	20%	The Gatekeeper. If the ATS can't parse it, or the links are dead, the resume is dead.
L2: Core Spec	15%	The Baseline. Knowing Python is expected. It's a "table stake," not a winning hand.
L3: Impact	25%	The Proof. This distinguishes "Coders" (who write lines) from "Engineers" (who solve problems).
L4: Storyline	25%	The De-Risker. A clear identity lowers the recruiter's cognitive load and Retention Risk.

L5: X-Factor	15%	The Tie-Breaker. Agency and architectural judgment separate Top 10% talent from the rest.
---------------------	------------	--

B. The Grader's Rubric (How to Score)

Use this guide to assign a score (0–10) for each layer. Be strict. Grade inflation hurts the student.

Layer 1: Foundation (20%)

- **10 Points:** Single-column; standard font; clickable links to active GitHub/Portfolio; perfect "Full Name (Acronym)" keyword usage.
- **5 Points:** Multi-column layout; inconsistent margins; generic LinkedIn link only.
- **0 Points:** Visual glitches; dead links; typo in contact info; photo/graphics included (for US resumes).

Layer 2: Core Spec (15%)

- **10 Points:** Skills grouped (Languages, Cloud, DBs); includes 2026 markers (RAG, Docker, CI/CD); no legacy noise.
- **5 Points:** "Alphabet Soup" list; mixes soft skills ("Communication") with hard skills; lists outdated tools (Eclipse, Java 7).
- **0 Points:** No skills section; lists only "Microsoft Office" or "Windows."

Layer 3: Impact (25%)

- **10 Points:** 100% of bullets use CAR format; 3+ hard metrics (% , \$, time); starts with Power Verbs ("Engineered").
- **5 Points:** Mixed quality; some metrics, but mostly "Responsible for..." or "Helped with..."
- **0 Points:** Passive voice; zero numbers; lists course syllabus descriptions instead of project outcomes.

Layer 4: Storyline (25%)

- **10 Points: The Specialist.** Summary, Skills, and Projects all align to one job title (e.g., "Mobile Engineer"). 6-Second Label is instant.
- **5 Points: The Split Personality.** Good skills, but applies for Backend roles with a resume full of Unity/Game Design.
- **0 Points: The Generalist.** Lists everything from Data Science to IT Helpdesk. Recruiter has no idea what they want.

Layer 5: X-Factor (15%)

- **10 Points: High Agency.** Includes an "Unassigned" project built for fun/utility. Bullets explain *why* technology was chosen.
- **5 Points: Syllabus Dependent.** Projects are good, but clearly all school assignments.
- **0 Points:** No projects; only coursework listed.

C. Score Interpretation & Benchmarks

90 – 100: Market Ready (Low Risk)

- **Status:** The "Green Light."
- **Advisor Action:** Focus on interview prep (LeetCode/System Design). This resume will get interviews.

75 – 89: The Tourist (Moderate Risk)

- **Status:** "Yellow Light." Good for internships, risky for full-time.
- **Common Flaw:** Usually fails on **Layer 3 (Impact)**. They did the work but wrote about it poorly.
- **Advisor Action:** Focus on "Resume Surgery"—rewriting bullet points to add metrics and outcomes.

0 – 74: The Student (High Risk)

- **Status:** "Red Light." Do not apply yet.
- **Common Flaw:** Fails **Layer 1 (Structure)** and **Layer 4 (Storyline)**.
- **Advisor Action:** Needs a "Tear Down." Reformat the document entirely and identify a specific target role before rewriting.
